

Eight-estate promenade

43 × 21

903 TILES · DRAWN ENVELOPE

An 8-estate service district on one straight street. The 43×21 envelope includes all local service buildings and the rear beauty reserves; shared workers, training, storage and production are separate.

■ Elite housing
 ■ Common housing
 ■ Science / culture
 ■ Health & safety
 ■ Beauty
 ■ Markets / storage
 ■ RB · roadblock

THE UPGRADE PATH

What an estate actually needs

Common housing ends at Townhouse. Elite housing is a separate 4x4 plot; the Palace is a civic building, not a house level. Requirements below accumulate.

ELITE LEVEL	NEW GOODS / SERVICE	SCORE	APPEAL TO ENTER*	PEOPLE
Residence	Food + fleece + olive oil	50	50 retain at ≥ 46	6
Mansion	Armor	60	60 retain at ≥ 56	10
Manor	Wine	70	70 retain at ≥ 66	16
Estate	Chariots + working Museum	80	80 retain at ≥ 76	20

*Hero: appeal entry thresholds come from the preceding housing level's evolution field; current-level lower thresholds describe devolution. Aim several points above entry values and confirm the house message. Common Townhouses need 45 culture/science, water, food, fleece, oil and 30 entry appeal.

Water: elite homes have their own supply. The worker block needs a staffed Fountain. Decorative ponds are not water service. **Health:** the Infirmary and Maintenance Office remain part of both plans.

Installed Atlantis score: scholars 15 + astronomers 20 + inventors 25 + curators 20 = 80. All four visits avoid dependence on the conditional +10 bonus.

Goods "1" in the model means a requirement, not one crate per month. One food type is sufficient for housing evolution. Do not mistake a variety of foods for a missing service.

ROADS MAKE THE DESIGN WORK

One street. No internal junctions.

1

Build the full street first.

Lay every road tile shown, including those through the Agora. Keep the two end roadblocks. The eastern exit connects to the city; leave the western exit closed or connect it beyond its roadblock.

2

Keep the planted boulevard verges.

In the elite district, columns 11–29 form a 19-tile boulevard. Its road is on row 11; rows 10 and 12 are planted verges. The houses touch those verges and have road access through the boulevard.

3

Protect the service route.

No shortcut roads through gardens, behind houses, or around the end roadblocks. Place city intersections outside the roadblocks. Delivery buyers and trained specialists can cross them; roaming service walkers turn back.

4

Check actual visits.

The geometry puts every home within the listed service ranges along the street. Staffing, dispatch direction, training delays and stocks still control how often visits happen. Inspect the overlays after construction.

THE REST OF THE CITY IS PART OF THE PLAN

Connect the three modules

Worker district

16 homes · up to 960 residents

Supply yard + city road

Storage · trainers · Palace

Elite district

8 estates · up to 160 residents

Both arrows meet the housing streets on the city side of their eastern roadblocks. These are functional connections, not a prescribed map arrangement. Keep granaries, universities and industry away from the elite beauty reserves; place negative-appeal structures at least seven tile steps from the nearest elite plot as a conservative separation.

SUPPLY	CHAIN TO KEEP WORKING	PRACTICAL STARTING RULE
Food	Farm / fishery / hunting / imports → Granary → Food stall → homes	Stock food before opening housing. Expand production using the food report; map yield and staffing determine the number of producers.
Fleece & olive oil	Carding Shed / Olive Press / imports → Storehouse → corresponding stalls	Keep dedicated bay space and continuous arrivals. Both common and elite housing consume these goods.
Armor & wine	Bronze → Armory; grapes → Winery; or imports → Storehouse → elite stalls	Reserve for the elite district. Add armor for Mansions and wine for Manors.
Chariots	Wood + horses from Horse Ranch → Chariot Factory → Chariot stall → estates	Build locally: chariots cannot be imported or exported. Feed the ranch with wheat from a farm, Storehouse or importing trade facility, not directly from a Granary. The factory needs wood and road access to the ranch for its hostler.
Training	University → Observatory + Museum; Inventors' Workshop → Laboratory; Bibliotheke → scholars	The supply yard has two of each trainer as a starting allowance for two districts. Increase capacity if a staffed venue waits for a specialist.
Workforce & taxes	Common homes → available workers; Palace + Tax Office → revenue	The three drawn modules employ 320 people with all optional buildings staffed, before producers and trade. Use the employment panel to size the common population; residents and available workers are different counts.

The three drawn envelopes total **1,963 tiles** before connector roads, terrain gaps and production. Only **903 tiles** belong to the elite district. This is a compact residential plan for an operating city; farmland, horse production and trade cannot be made terrain-independent.

CONSTRUCTION SEQUENCE

Build in this order

1

Start with common homes and basic services.

Reserve the worker footprint. Place roads, roadblocks, a Fountain, Maintenance Office, food stall and enough food supply. Fill the homes gradually; avoid opening every staffed building at once.

2

Stabilize the workforce and supply network.

Add fleece, oil, health and the three common culture/science services. Build their trainers. Target Townhouses, check employment, then build the Palace and collect taxes.

3

Prepare the elite grounds.

Lay the elite road and Agora, then the boulevard, ponds and park tiles. Finish the beauty reserves before placing elite housing. No earned monuments or divine bonuses are assumed.

4

Staff all elite services.

Keep the Infirmary and Maintenance Office operating. Supply all four culture/science visits and the Museum or Stadium. Check that specialists reach their venues from the yard.

5

Place elite plots with goods available.

Eight plots require 16 crates of food, 8 fleece and 8 olive oil for initial placement, in addition to their drachma cost. Keep replenishing through the Agora afterward.

6

Advance through Mansion, Manor, Estate.

Add armor, wine and the final mount supply. Read each house's right-click explanation. Aim for appeal above the entry threshold, rather than depending on the lower devolution threshold.

7

Observe a full game year.

With trainer service/goods boosts off, follow the farthest houses and the supply chain for 12 game months. Check seasonal food, service columns, health, hazards, employment and upgrades.

A COPYABLE ACCEPTANCE CHECKLIST

Ready for eight estates?

☐ Roadblocks are at both ends; the city junction is outside them.

☐ Every active service has all workers and can reach the road.

☐ The elite boulevard has both planted verges; all ponds and parks are built.

☐ Each elite plot has sufficient appeal, verified in the house message.

☐ All four science / culture services have recently visited every elite home.

☐ The Museum / Stadium is operating and receiving its trained specialists.

☐ Food, fleece, olive oil, armor, wine and final mount supply reach the Agora.

☐ The worker district has water, health, maintenance and a stable workforce.

☐ Each elite home becomes an Estate with 20 residents as immigration fills it.

☐ A 12-month check with trainer boosts off shows stable services and supplies.

0 of 10 observations checked.

Saved in this browser when local storage is available. Checking these boxes records your observations; it does not change the game.

PLACEMENT LEDGER

Coordinates for the selected district

Columns increase left to right, rows top to bottom. Coordinates are the upper-left tile of each footprint. Rotate the entire plan as one unit if the map demands it. Every park square is one tile; detailed park coordinates are in the CSV export.

LABEL	BUILDING	COLUMN, ROW	FOOTPRINT	JOBS
E1	Elite plot 1	11, 6	4x4	0
POND	Fish Pond	11, 2	4x4	0
E2	Elite plot 2	16, 6	4x4	0

PARK	106 individual park tiles; see grid / CSV	Various	1x1 each	0

IF A HOME STOPS IMPROVING

Find the missing link

► "The neighborhood is not attractive enough."

► "Needs more culture / science."

► The Agora is empty, but the city owns goods.

► Water, health or maintenance coverage fades.

► Can I tile this elite module across the map?

EVIDENCE & LIMITS

What was researched and verified

The installed game contains editable model data and a compiled executable, rather than the original engine source. This guide uses those models, the local trainer's documented structure offsets, selected disassembly from this exact executable, the official manuals, and community footprint / walker reference tables. It does not patch game rules or require the trainer.

- [Installed Hero difficulty model](#), plus all four other difficulty files: housing capacities, cumulative requirements, appeal thresholds, costs, jobs and desirability parameters.
- [Executable house-scoring disassembly](#) and [local science research](#): the installed Atlantis weights are 15 scholar + 20 astronomer + 25 inventor + 20 curator. Greek weights are 15 philosopher + 20 athlete + 25 actor + 20 competitor.
- [Official Zeus manual](#), [local PDF](#) — printed pp. 25–27, 29–34, 71–77, 83–97, 105–110, 154–156. Also available from [Sierra Help](#). Covers walker behavior, separate housing classes, elite water, hygiene, markets, culture and boulevards.
- [Official Poseidon manual](#), [local PDF](#) — printed pp. 10–13 and 18–19; [Steam copy](#). Covers science training, Museum uniqueness, horses, wood and chariots.
- [Citadel of Poseidon: building footprints](#) and [walker distances](#). The checker uses the community-reported 27-tile healer / water range, 35-tile culture / science / tax range and 44-tile peddler / maintenance / watch range; these distance limits were not reverse-engineered independently.
- [Research and validation notes](#), [geometry-check results](#), [machine-readable design](#), and [quick build guide](#).

Validation boundary. Footprints, permitted overlaps, road frontage, road connectivity, service-to-house distances and installed-model requirements are checked by the included validator. This proposal has not been built and observed in the game. Exact beauty, repeated walker delivery, production throughput

and scenario restrictions still need the in-game checklist. No claim of a mathematically optimal or universally "perfect" city is made.
